## **DETAILED ACTION**

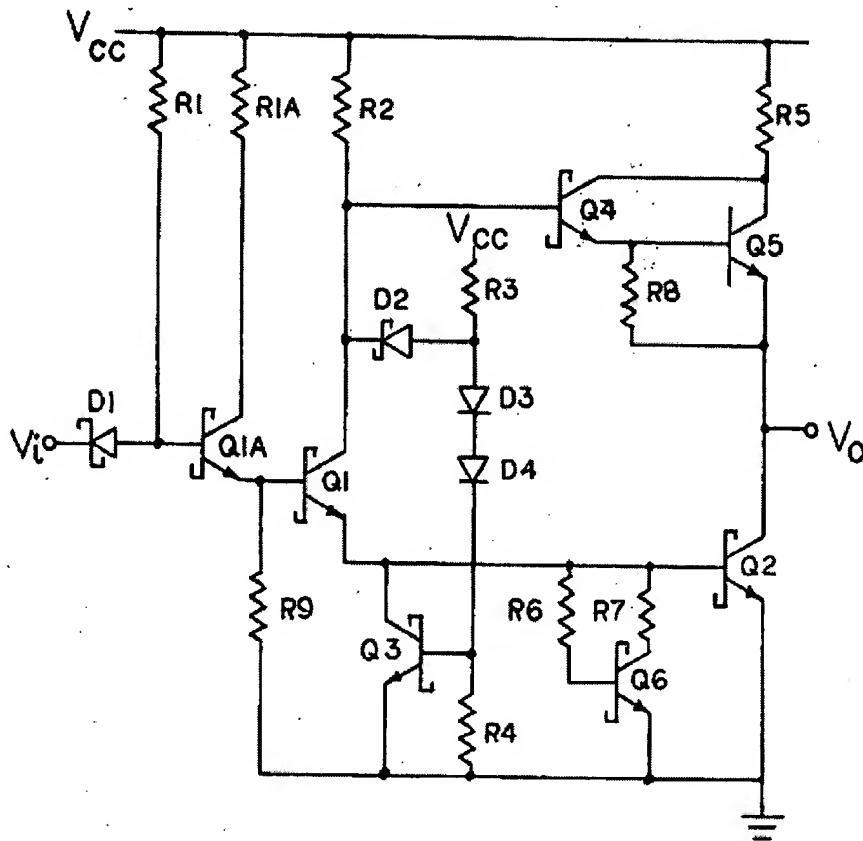

### ***Claim Rejections - 35 USC § 102***

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 5-7, 9-18 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by Griffith (USP 4,330,723). Griffith discloses the claimed the delay circuit (R3, D3, D4) the input constant voltage (Vcc), the output circuit (Q2), and the bootstrap circuit (Q4, Q5) – the Darlington connected current source circuit that is used to heighten the input impedance. See figure below.

### ***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 8 and 14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Griffith (USP 4,330,723) in view of Berringer et al. (USP 5,103,148). Griffith discloses the claimed invention (see above paragraph) except for having a delay circuit comprising of a capacitor and resistor- a RC circuit and is connected through a current mirror circuit. Berringer discloses that it is known in the art to provide a delay circuit

comprising of a capacitor and resistor- a RC circuit and is connected through a current mirror circuit. It would have been obvious to one having ordinary skill in the art at the time of the invention was made to provide the transistor logic output device of Griffith with the a delay circuit comprising of a capacitor and resistor- a RC circuit and is connected through a current mirror circuit of Berringer, in order to provide a current delayed circuit to provide a signal to control the switching of the output transistor.
